

Components Required:

- **ATtiny85**
 - **TMP36 Temperature Sensor**
 - **LEDs** (White, Red, Green, Blue, etc.)
 - **220Ω Resistors** (for each LED)
 - **3V Coin Cell Battery**
 - **DPST Switch**
 - **Breadboard & Jumper Wires**
 - **Tinkercad Simulation Platform**
-

About TMP36:

- TMP36 outputs analog voltage proportional to temperature.
 - Output voltage is approximately:
 $V_{out} \text{ (in volts)} = 0.5 + (\text{Temperature in } ^\circ\text{C} \times 0.01)$
-

Connections:

TMP36:

- **Pin 1 (GND)** → ATtiny85 GND (e.g., PB3 or PB0)
- **Pin 2 (Vout)** → **PB4** of ATtiny85 (Analog Input)
- **Pin 3 (Vcc)** → +3V from Coin Cell Battery (via switch)

LEDs:

- LEDs connected to **PB0, PB1, PB2** of ATtiny85
- **Cathode of each LED** → through **220Ω resistor** → **GND**

Power Setup:

- **Coin Cell Battery (+)** → DPST Switch → **Vcc of ATtiny85**
- **Coin Cell Battery (-)** → **GND of ATtiny85**
